CampusEvent

Project Proposal

1.1 Project Name

CampusEvent – University Event Management and QR Ticketing Platform

1.2 Problem Statement

University students often have difficulty discovering campus events and keeping track of activities organized by different student clubs. Event registration and attendance processes may be managed through separate platforms or manually, which can cause communication problems, registration difficulties, and inefficient attendance tracking.

1.3 Supporting Evidence

The project addresses common challenges in university event management, such as fragmented event announcements, manual registration processes, and difficulties verifying attendance.

The team will support this problem statement by collecting feedback from university students and student club representatives through a short survey.

1.4 Stakeholder Identification

- Students: Browse events, register, and receive digital tickets.
- Student Clubs: Create and manage events and monitor registrations.
- Event Organizers: Verify tickets and manage event attendance.
- System Administrators: Manage users, events, and platform operations.

1.5 Proposed Solution

CampusEvent is a centralized web-based platform that allows university clubs to organize events and students to participate through a digital registration system.

The platform will provide event listings, event creation, student registration, QR-code-based digital tickets, and QR code verification at event entrances.

1.6 Expected Outcomes

- Easier access to university events.
- Centralized event management.
- Faster student registration.
- Digital ticket generation.
- More efficient attendance verification.
- Better communication between students and university clubs.

1.7 Feasibility Assessment

The project is technically feasible using commonly available web development technologies, a database, and QR code generation and scanning libraries.

The first version will focus on essential features and will not require expensive hardware or paid external services.

1.8 Initial Project Scope

In Scope:

- User registration and login.
- Student and club accounts.
- Event creation and management.
- Event browsing and searching.
- Event registration.
- QR code ticket generation.
- QR code ticket verification.
- Attendance tracking.

Out of Scope:

- Online payment systems.
- Live streaming.
- Social media integration.
- Advanced recommendation algorithms.

1.9 Assumptions and Potential Risks

Assumptions:

- Students and clubs have internet access.
- Users have devices capable of displaying or scanning QR codes.
- Club representatives are authorized to create events.

Potential Risks:

- Unauthorized access to accounts.
- Duplicate ticket usage.
- QR code scanning failures.
- Technical problems during event registration.
- Delays in team development.

1.10 Open-Source License

The team proposes using the MIT License, which allows others to use, modify, and distribute the project under its license conditions.
