2. System Vision and Boundary Specification

CampusEvent — University Event Management and QR Ticketing Platform

2.1 Project Purpose

The **CampusEvent** platform directly solves the operational fragmentation inherent in university event management. Currently, campus activity announcements, student registrations, and attendance tracking are managed through disconnected channels, leading to communication gaps and inefficient verification at event entrances.

The primary purpose of the system is to establish a unified, web-based ecosystem connecting university student clubs directly with the student body. By centralizing event discovery, digital registrations, and QR-code-based ticket verification, CampusEvent ensures transparent coordination and dependable operational auditability.

2.2 Target Users & Stakeholders

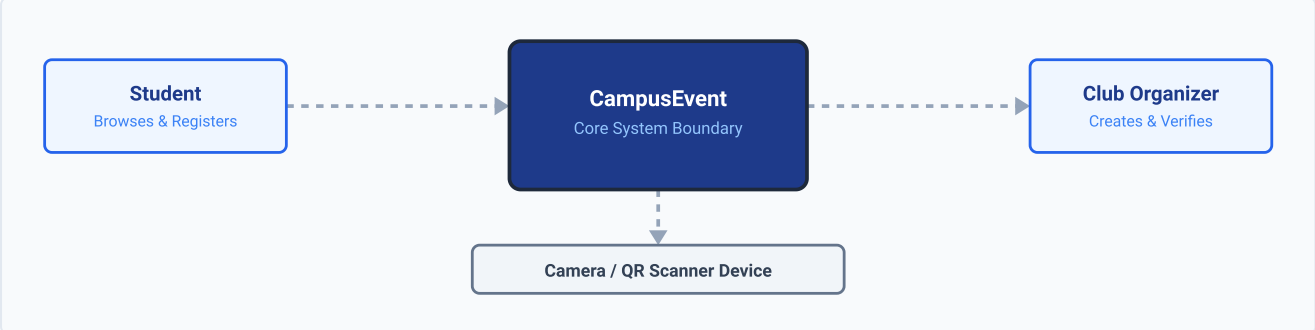

- **Students (Primary Users):** Require a centralized catalog to browse upcoming campus events, register instantly, and receive digital QR-code tickets.
- **Student Clubs & Event Organizers (Operational Users):** Require management tools to publish and update event details, monitor real-time registration lists, and conduct ticket verification at event entrances.
- **System Administrators:** Responsible for maintaining platform stability, supervising user account permissions, and ensuring system policy compliance.

2.3 System Responsibilities and Core Functionalities

The CampusEvent software system is explicitly responsible for managing the following core operations:

- **User Authentication & Account Management:** Distinguishing between student, club, and administrative roles.
- **Event Catalog & Discovery:** Centralized interface for listing, searching, and filtering active campus activities.
- **Registration & QR Ticketing Lifecycle:** Processing student registrations and automatically issuing unique digital QR-code tickets.
- **Entrance Verification & Attendance Tracking:** Scanning QR codes at venue entrances to maintain auditable attendance logs.

2.4 System Context Diagram

2.5 Scope Boundary

- • User registration and login (Student & Club accounts)
- • Event creation, management, browsing, and search
- • Student event registration (RSVP) workflow
- • Digital QR code ticket generation
- • Entrance QR ticket validation and attendance tracking
- • Online payment and ticketing fee systems
- • Live video streaming of events
- • Third-party social media auto-posting APIs
- • Machine-learning event recommendation engine

In-Scope (Sprint 1 Release)	Out-of-Scope (Deferred Features)

2.6 Assumptions and System Constraints

Category	Statement
Assumption	Students and club representatives possess internet access and standard devices capable of displaying or scanning QR codes.
Assumption	Student club representatives are officially authorized by the university to publish events.
Constraint	The software system must be completely delivered within the academic semester timeframe.
Constraint	First release targets standard modern web browsers via responsive design (no dedicated native mobile apps).
